

# SENSITIVE METADATA RISK – CLIENT SETUP

## 1 System architecture

### 1.1 Component

Component	IP address
Client Laptop (Windows OS/Ubuntu OS)	CLIENT_IP
MITM Proxy Server	SERVER_IP
Virtual Phone (AVD)	Running on Client's Laptop

### 1.2 System architecture

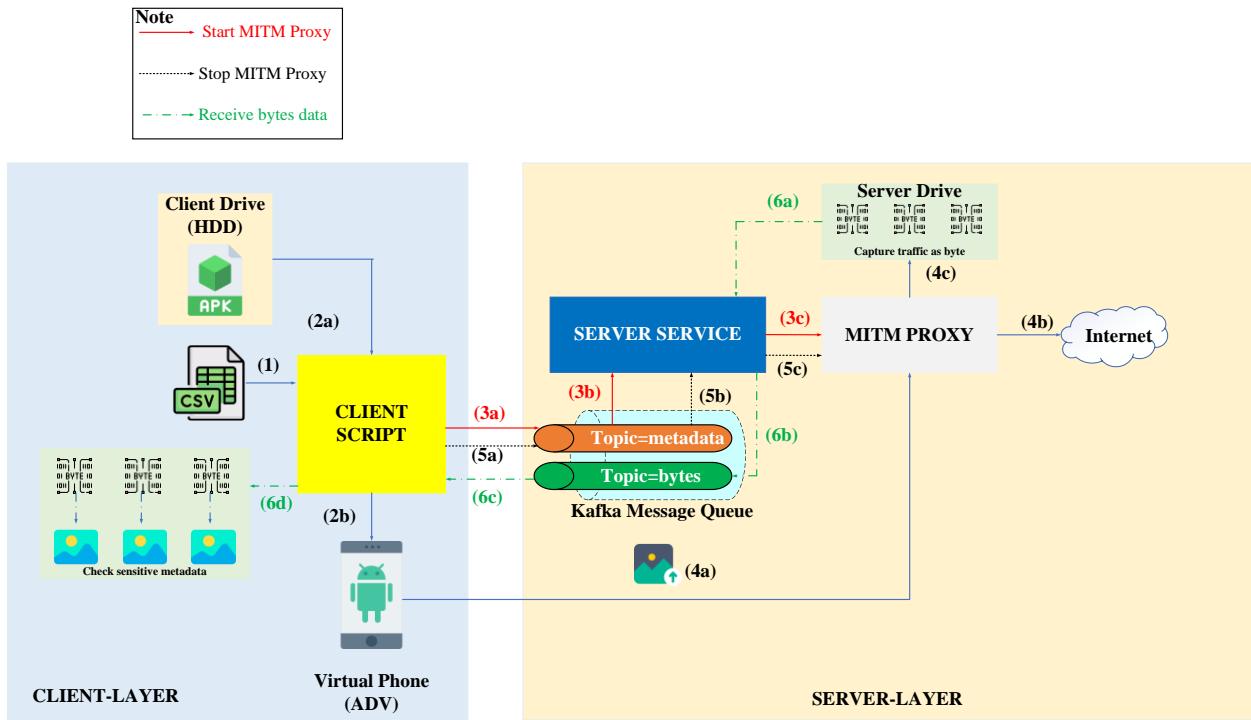

Figure 1: System architecture

The system includes two layers: a **client layer** and a **server layer**.

In the client layer, we have two components: client script and virtual phone (ADV).

We have three server layer components: the server service, the Man-in-the-middle proxy (MITM Proxy), and the Kafka message Queue. In Kafka, we will have two topics auto-created by the server service. The **metadata** topic is used to control (start/stop) MITM Proxy, and the **bytes** topic is used to receive the traffic captured by MITM Proxy.

Firstly, the client script reads APK information from the CSV file (1). The APK information includes the APK name and APK package. Then, the client script uses APK's information to query APK in the drive and install it on ADV (2a-2b).

After installation, the client script will auto-launch the app and push the "start" command to Kafka on topic=metadata. This command receives by the server service and starts the MITM Proxy (3a-3b-3c).

The user upload/send/share the image with sensitive metadata via the app to the internet through MITM Proxy (4a-4b). At this time, MITM Proxy will capture all upload traffic from the app and save it as bytes (4c).

When the user finishes the test, they uninstall the app. This action triggers the client script to send the "stop" command to Kafka on topic=metadata (5a-5b-5c).

After the MITM Proxy stop, the server service reads all captured traffic bytes and sends them to the client script on Kafka topic=bytes (6a-6b-6c).

When the client script receives all messages, it will convert these bytes to images and check if they contain sensitive metadata (6d).

## 1.1 Demo video

Install the client on Ubuntu OS: [https://youtu.be/feTJm\\_ykjYQ](https://youtu.be/feTJm_ykjYQ)

Install the client on Windows OS: <https://youtu.be/rUCk2TM58Z0>

Running test code (whole system): [https://youtu.be/Xj\\_IluWAnMw](https://youtu.be/Xj_IluWAnMw)

## 2 Install Ubuntu dependencies

```
server_machine:~# apt-get update  
server_machine:~# apt-get upgrade
```

### 2.1 git

```
server_machine:~# apt-get install git  
server_machine:~# git --version
```

```
root@ubuntu-desktop:~# git --version  
git version 2.34.1
```

### 2.2 Java version 11

```
server_machine:~# apt install openjdk-11-jdk
```

```
server_machine:~# java -version
```

```
root@ubuntu-desktop:~# java -version
openjdk version "11.0.19" 2023-04-18
OpenJDK Runtime Environment (build 11.0.19+7-post-Ubuntu-0ubuntu122.04.1)
OpenJDK 64-Bit Server VM (build 11.0.19+7-post-Ubuntu-0ubuntu122.04.1, mixed mode, sharing)
root@ubuntu-desktop:~#
```

## 2.3 Install snapd

```
server_machine:~# apt install snapd
```

## 2.4 Install net-tools

```
server_machine:~# apt-get install net-tools
```

# 3 Install a Virtual Phone (on the client)

## 3.1 Install Android Studio on Client Windows OS

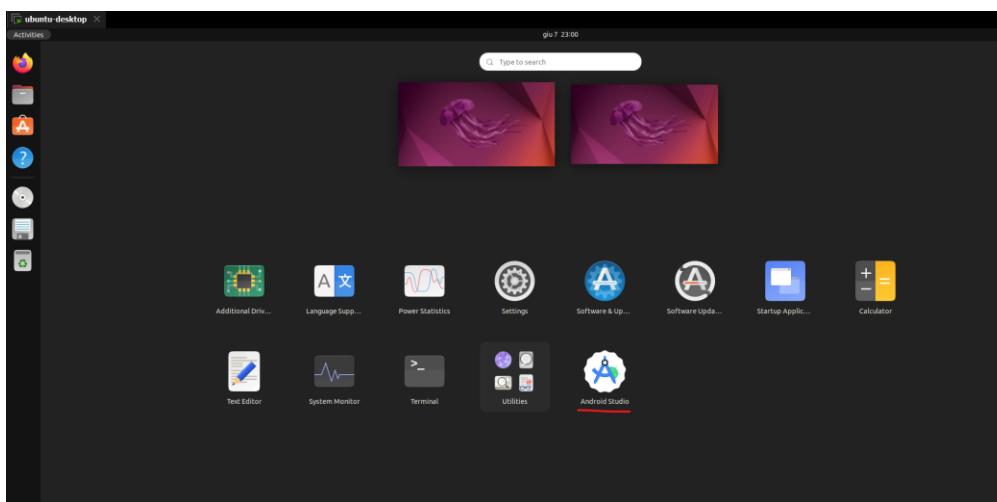

Download Android Studio <https://developer.android.com/studio>

Install as normal software

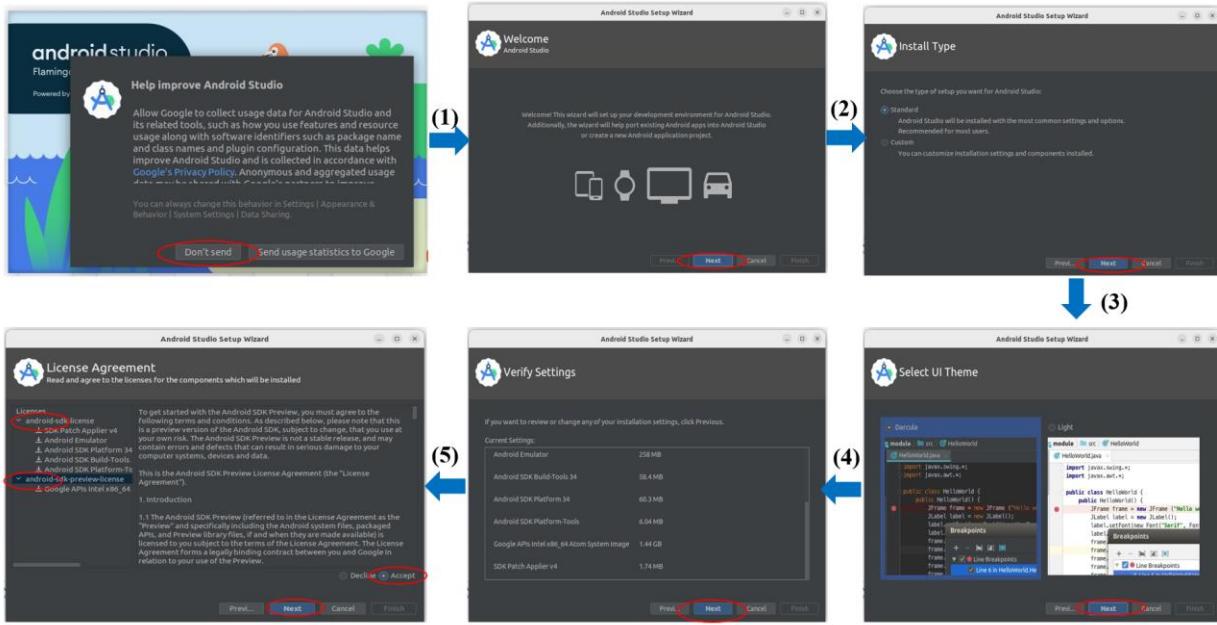

## 3.2 Install Android Studio on Client Ubuntu OS (desktop version)

```
ubuntu_client:~# snap install android-studio --classic
```

```
root@ubuntu-desktop:~# snap install android-studio --classic
android-studio 2022.2.1.19 from Snapcrafters● installed
```

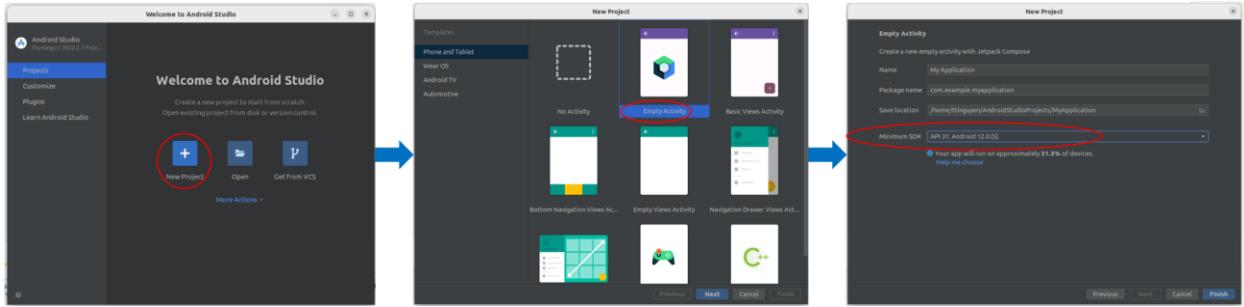

Config

### 3.3 Create new project

Note: do the same for both Windows OS and Ubuntu OS

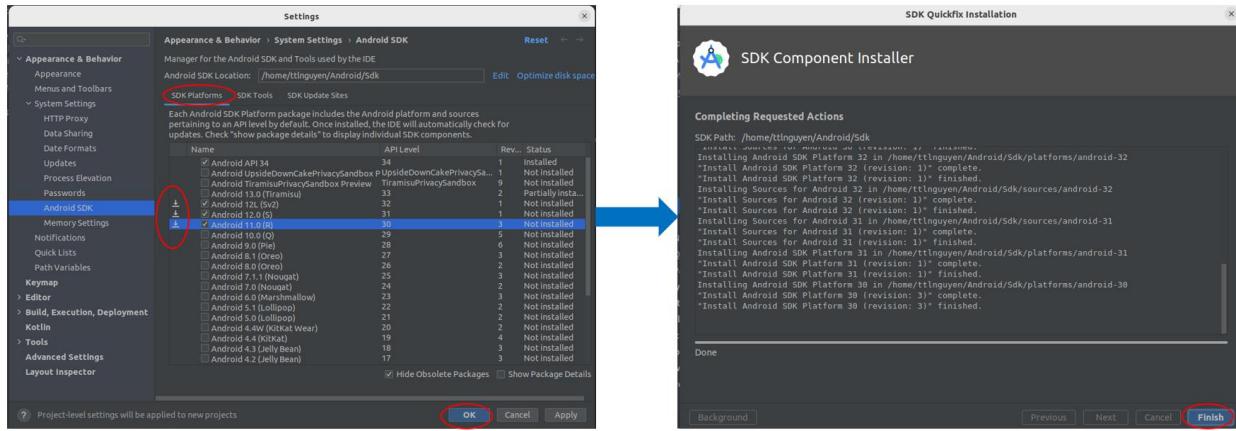

### 3.4 Install SDK

Note: do the same for both Windows OS and Ubuntu OS

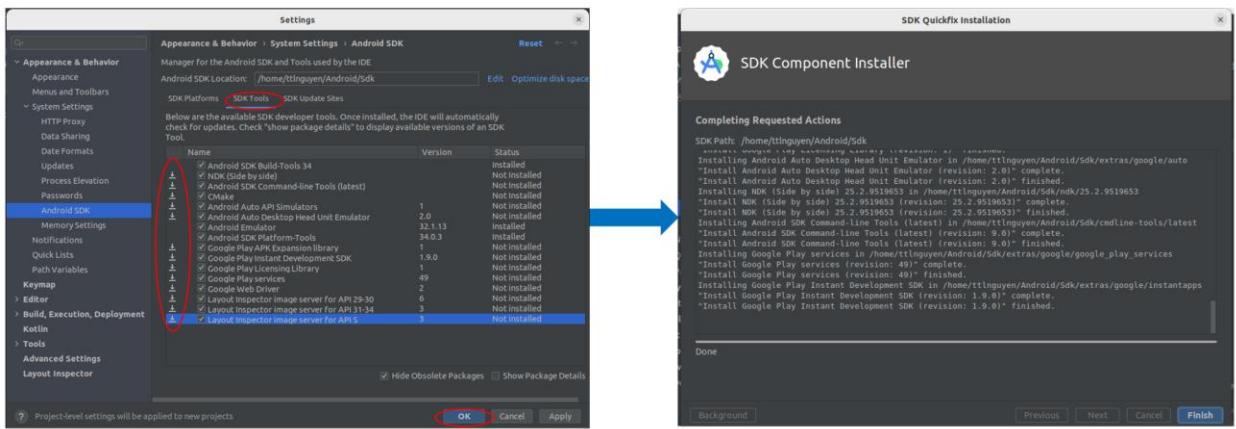

#### 3.4.1 SDK Platforms

Tools → SDK Manager → SDK Platforms

### 3.4.2 SDK Tools

Tools → SDK Manager → SDK Tools

## 3.5 Setup adb

Note: do only for Ubuntu OS

Check adb path

```
ubuntu_client:~# ls -al /home/tlnguyen/Android/Sdk/platform-tools/
```

```

root@distarossi-ttln:~# ls -al /home/ttlnguyen/Android/Sdk/platform-tools/
total 14436
drwxrwxr-x 3 ttlnguyen ttlnguyen 4096 giu 8 10:58 .
drwxrwxr-x 19 ttlnguyen ttlnguyen 4096 giu 8 11:25 ..
-rwxrwxr-x 1 ttlnguyen ttlnguyen 7890744 giu 8 10:58 adb

-rwxrwxr-x 1 ttlnguyen ttlnguyen 1490224 giu 8 10:58 sqlite3
root@distarossi-ttln:~# 
```

Create link

```
ubuntu_client:~# nano ~/.bashrc
```

ADD

```
alias adb='/home/ttlnguyen/Android/Sdk/platform-tools/adb'
```

```

ubuntu-lab  ubuntu-lab | .bashrc *
GNU nano 6.2
#!/bin/sh
# ~/.bashrc: executed by bash(1) for non-login shells.
# see /usr/share/doc/bash/examples/startup-files (in the package bash-doc)
# for examples
alias adb='/home/ttlnguyen/Android/Sdk/platform-tools/adb'
# If not running interactively, don't do anything
[ -z "$PS1" ] && return
# don't put duplicate lines in the history. See bash(1) for more options
# ... or force ignoreups and ignorespace
HISTCONTROL=ignoreups:ignorespace

```

```
ubuntu_client:~# source ~/.bashrc
```

Check

```
root@ubuntu-desktop:~# adb devices
```

```

root@ubuntu-desktop:~# adb devices
List of devices attached
root@ubuntu-desktop:~# 
```

Note: there is no AVD now!

Create \$PATH environment

```
ubuntu_client:~# nano ~/.profile
```

ADD

```

export ANDROID_HOME="/home/ttnguyen/Android/Sdk"
export PATH="$ANDROID_HOME/tools:$PATH"
export PATH="$ANDROID_HOME/platform-tools:$PATH"
export PATH="$ANDROID_HOME/emulator:$PATH"

```

```

GNU nano 6.2
# ~/.profile: executed by Bourne-compatible login shells.
export ANDROID_HOME="/home/ttnguyen/Android/Sdk"
export PATH="$ANDROID_HOME/tools:$PATH"
export PATH="$ANDROID_HOME/platform-tools:$PATH"
export PATH="$ANDROID_HOME/emulator:$PATH"
[]

if [ "$BASH" ]; then
    if [ -f ~/.bashrc ]; then
        . ~/.bashrc
    fi
fi

msg n 2> /dev/null || true

```

ubuntu\_client:~# source ~/.profile

## Check \$PATH

ubuntu\_client:~# echo \$PATH

```

root@distarossi-ttlni:~# echo $PATH
/home/ttnguyen/Android/Sdk/emulator:/home/ttnguyen/Android/Sdk/platform-tools:/home/ttnguyen/Android/Sdk/tools:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin
root@distarossi-ttlni:~

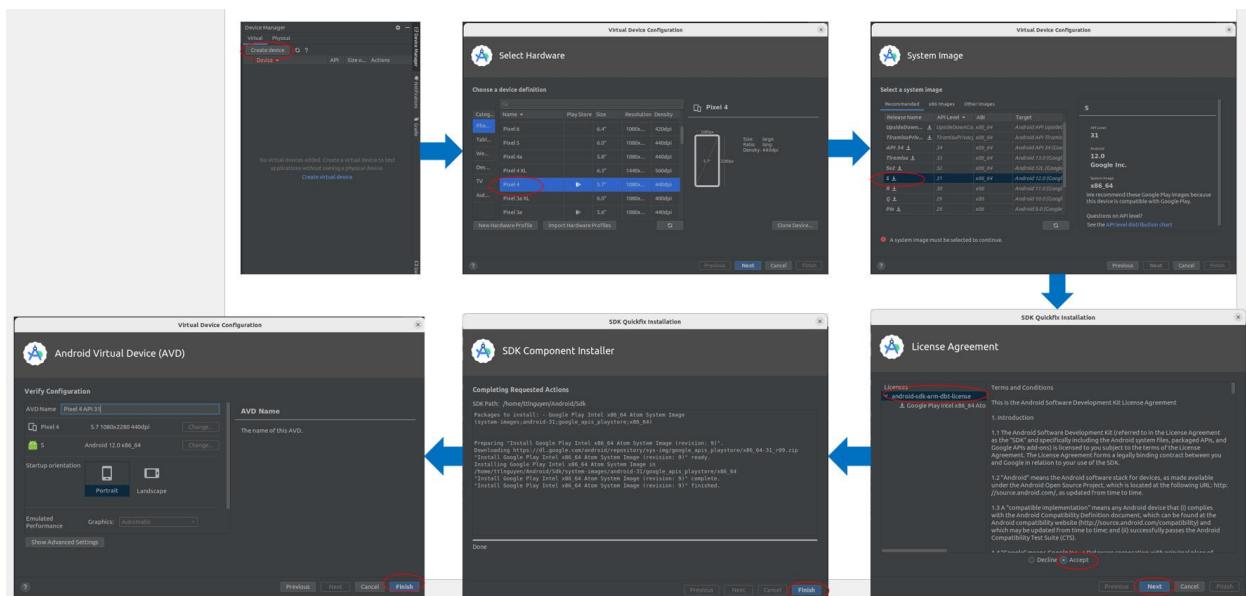

```

## 3.6 Create AVD (Virtual Phone)

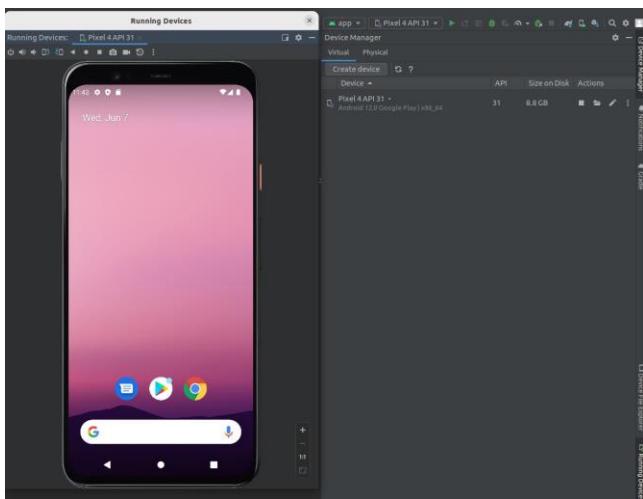

Note: do the same for both Windows OS and Ubuntu OS

### Chose Pixel 4

Chose Android version 12 (API 31)

Run AVD

## Check

ubuntu\_client:~# adb devices

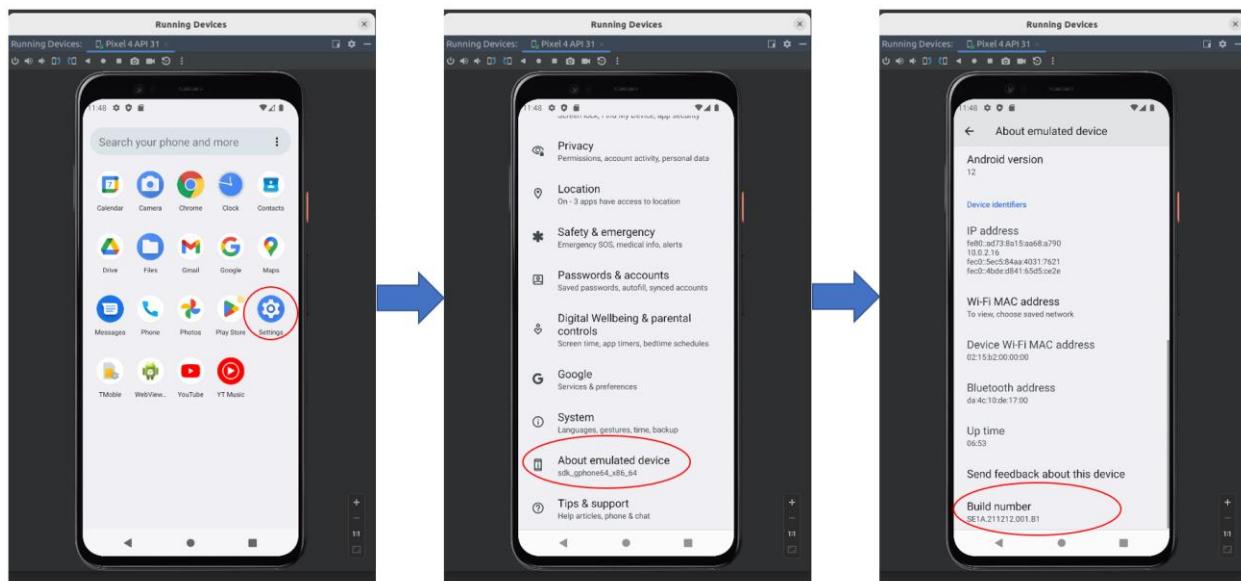

```
root@lam-G550JK:~# adb devices
List of devices attached
emulator-5554    device

root@lam-G550JK:~# [REDACTED]
```

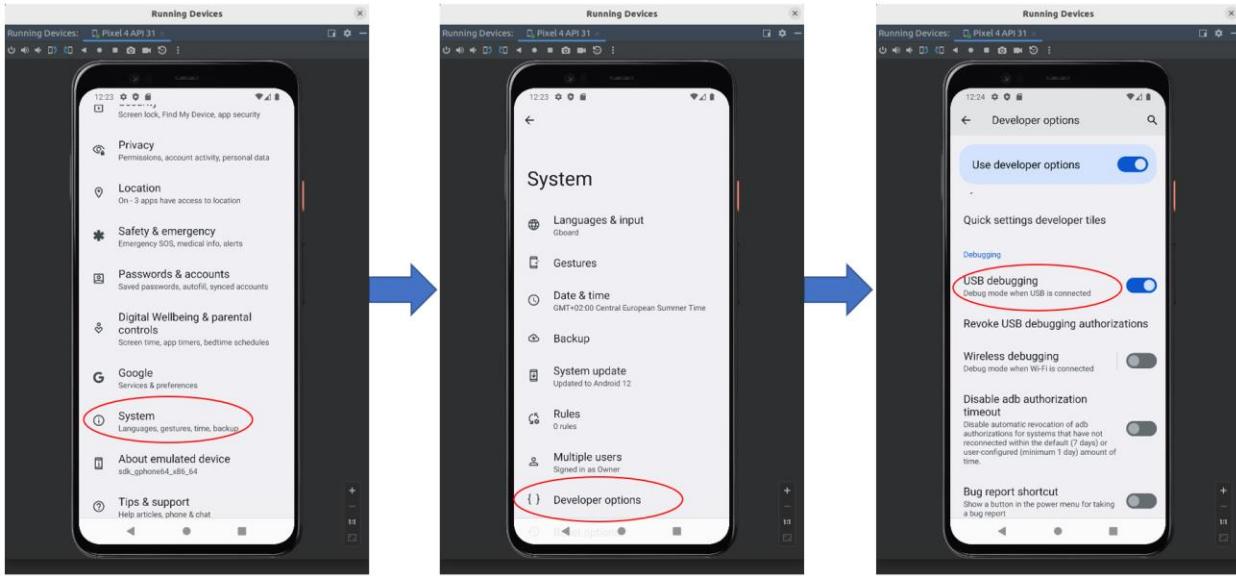

## 3.7 Root AVD for Ubuntu OS

### 3.7.1 Enable Developer Mode

Settings → About emulated device → Build number (click 7 times)

### 3.7.2 Enable USB Debugging

### 3.7.3 Download root script

```
ubuntu_client:~# git clone https://github.com/thanhlam2110/rootAVD-1.git
```

```
ubuntu_client:~# cd rootAVD-1/
```

```
ubuntu_client:~/rootAVD-1# chmod -R 777 *
```

### 3.7.4 Install Magisk

Check ramdisk.img path

```
ubuntu_client:~# ls -al /home/lam/Android/Sdk/system-images/android-31/google_apis_playstore/x86_64
```

```
root@lam-G550JK:~# ls -al /home/lam/Android/Sdk/system-images/android-31/google_apis_playstore/x86_64
total 3006312

```

## Result

### 3.7.5 Config Root by Magisk

### Reboot by adb command

```
ubuntu_client:~# adb reboot
```

### 3.7.6 Grant root user for adb shell

```
ubuntu_client:~# adb shell
```

```
emulator64_x86_64_arm64:/ $ su
```

```

emulator64_x86_64_arm64:/ # whoami
root@lam-G550JK:~# adb shell
emulator64_x86_64_arm64:/ $ su
emulator64_x86_64_arm64:/ # whoami
root
emulator64_x86_64_arm64:/ #

```

## 3.8 Root AVD for Windows OS

### 3.8.1 Enable Developer Mode

Do the same step 3.7.1

### 3.8.2 Enable USB Debugging

Do the same step 3.7.2

### 3.8.3 Download root script

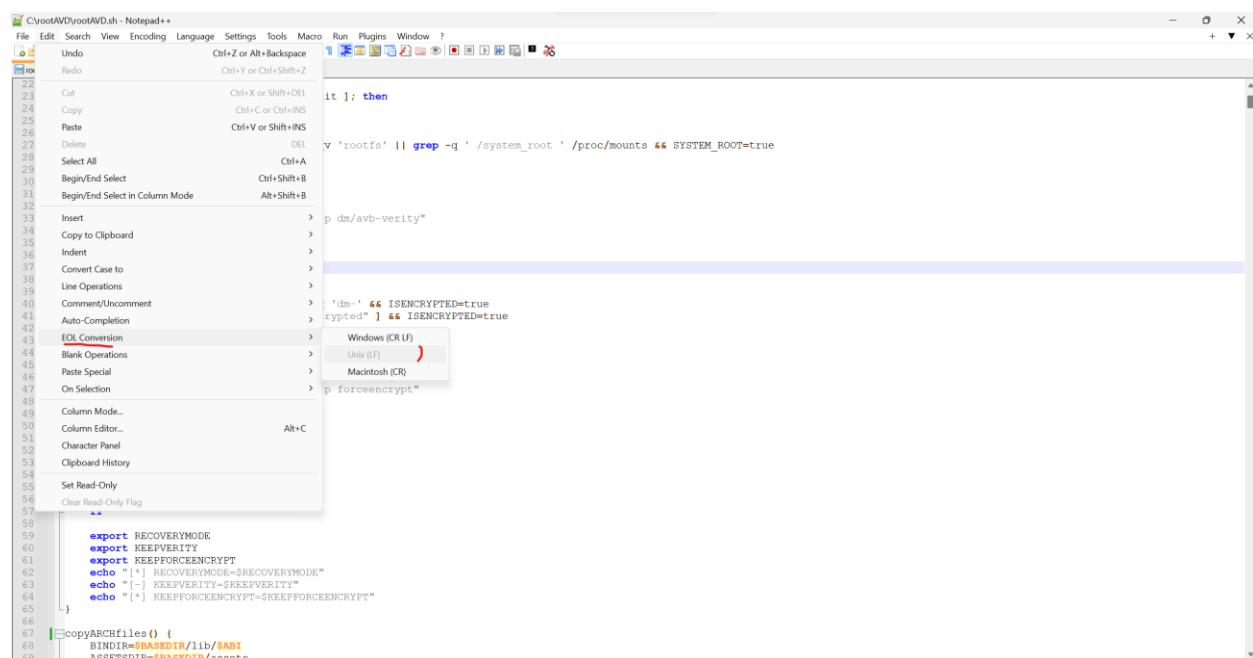

Do the same step 3.7.3

### 3.8.4 Install Magisk

Open file rootAVD.bat with Notepad++

Fix EOL Conversion from Windows (CR LF) to Unix (LF)

Edit → EOL Conversion → chose Unix (LF)

**Run this command below in CMD (Administrator)**

C:\rootAVD>rootAVD.bat C:\Users\ASUS\AppData\Local\Android\Sdk\system-images\android-31\google\_apis\_playstore\x86\_64\ramdisk.img

Note: change **ASUS** based on your machine!

### 3.8.5 Config Root by Magisk

Do the same step 4.7.5

### 3.8.6 Grant root user for adb shell

Do the same step 4.7.6

## 4 Setup MITM proxy certificate on AVD

Note: do the same for both AVD on Windows OS and Ubuntu OS

### 4.1 Copy source

```
ubuntu_client:~# git clone https://github.com/thanhlam2110/metadata-root-adv.git
```

```
ubuntu_client:~# cd metadata-root-adv/
```

```
ubuntu_client:~/metadata-root-adv # adb push AlwaysTrustUserCerts.zip /sdcard/Download/
```

```
root@lam-G550JK:~/root_android_phone# adb push AlwaysTrustUserCerts.zip /sdcard/Download/
AlwaysTrustUserCerts.zip: 1 file pushed, 0 skipped. 6.7 MB/s (3574 bytes in 0.001s)
```

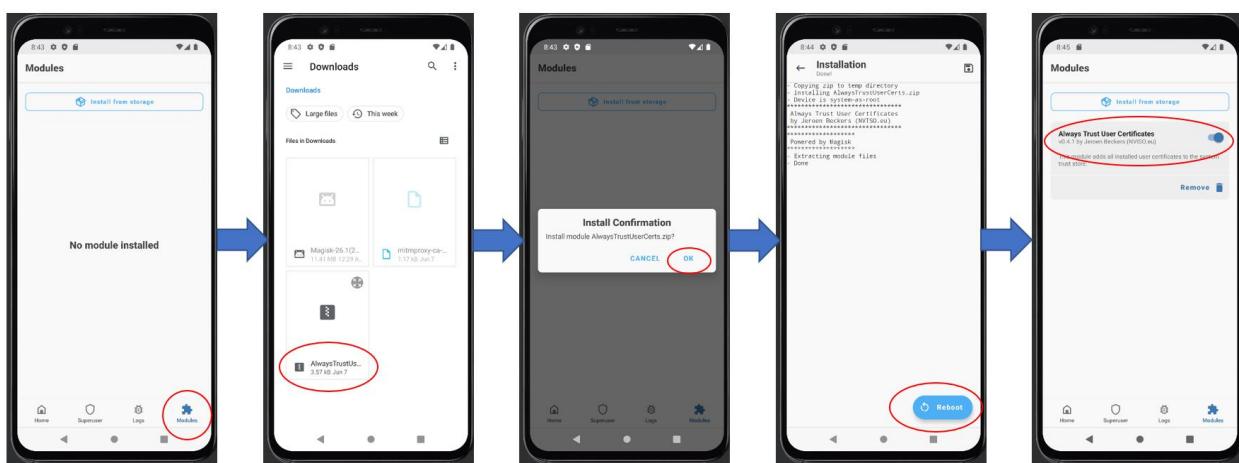

```
ubuntu_client:~/metadata-root-adv# adb push mitmproxy-ca-cert.cer /sdcard/Download/
```

```
root@lam-G550JK:~/root_android_phone# adb push mitmproxy-ca-cert.cer /sdcard/Download/
mitmproxy-ca-cert.cer: 1 file pushed, 0 skipped. 0.3 MB/s (1172 bytes in 0.004s)
root@lam-G550JK:~/root_android_phone#
```

### Note:

The file **mitmproxy-ca-cert.cer** is automatically generated during the installation of the MITM Proxy server, and each server has a corresponding certificate at path (**/root/.mitmproxy**). So, at this step, please ask **mitmproxy-ca-cert.cer** from the MITM Proxy Server administrator.

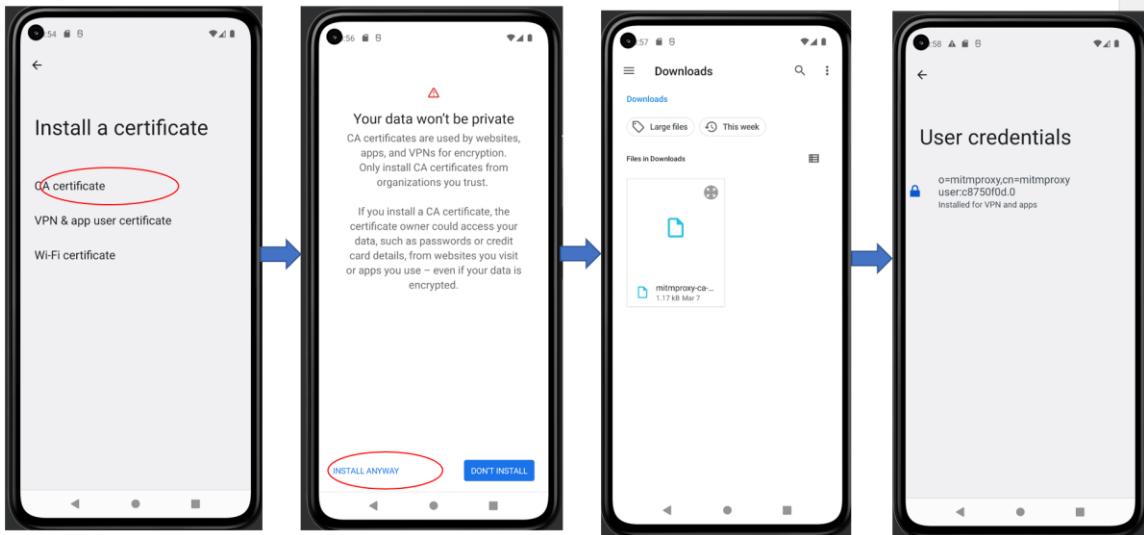

### 4.2 Install AlwaysTrustUserCerts

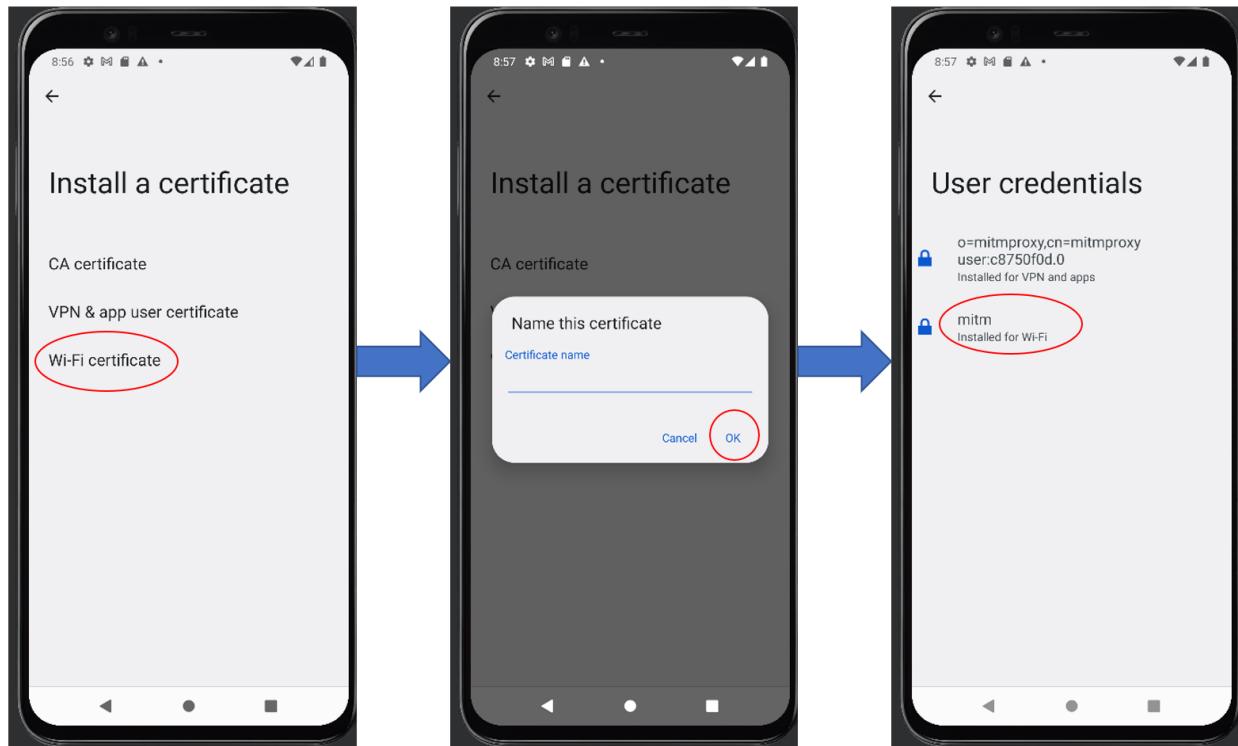

#### 4.3 Install MITM certificate

Settings → Security → Encryption & Credentials → Install a certificate

##### CA certificate

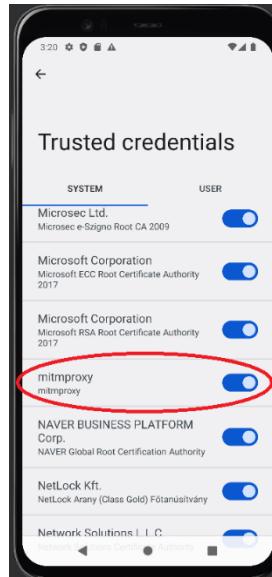

##### Wifi Certificate

```
ubuntu_client:~/root_android_phone# adb reboot
```

Result

## 4.4 Check using MITM Proxy Server capture upload image traffic

### 4.4.1 Copy image has metadata

```
ubuntu_client:~/root_android_phone# adb push LANDSCAPE_ORIGIN.jpg /sdcard/Download/
```

```
root@lam-G550JK:~/root_android_phone# adb push LANDSCAPE_ORIGIN.jpg /sdcard/Download/
LANDSCAPE_ORIGIN.jpg: 1 file pushed, 0 skipped. 10.7 MB/s (74490 bytes in 0.007s)
root@lam-G550JK:~/root_android_phone# adb push LAPTOP-ORIGIN.jpg /sdcard/Download/
LAPTOP-ORIGIN.jpg: 1 file pushed, 0 skipped. 22.3 MB/s (116896 bytes in 0.005s)
root@lam-G550JK:~/root_android_phone# 
```

### 4.4.2 Redirect traffic to MITM proxy

```
ubuntu_client:~# adb shell settings put global http_proxy SERVER_IP:8080
```

### 4.4.3 Run MITM proxy server

```
server_machine:~# mitmweb --web-host 0.0.0.0 --web-port 8081 --set block_global=false
```

#### 4.4.4 Test upload image and capture traffic my MITM Proxy

The screenshot shows a NetworkMiner interface with a list of captured network flows. One flow is selected, showing a request to Google Drive. The response section displays the captured image. The image itself is a street view of a building with a 'TICOTA' sign. Below the image, detailed metadata is shown:

- Format: JPEG (ISO 10918)
- jfif.version: (1, 1)
- jfif.density: (72, 72)
- jfif.unit: 1
- make: samsung

Use Google Drive on Virtual Phone and upload one image. If you can capture traffic by the MITM Proxy like figure. You succeed.

## 5 Install Running-Script Environment on Client Ubuntu OS

### 5.1 Install python

Check python version

```
ubuntu_client:~# python3 --version
```

```
root@ubuntu-desktop:~# python3 --version
Python 3.10.6
```

Install pip

```
ubuntu_client:~# apt-get install python3-pip
```

```
ubuntu_client:~# pip --version
```

```
root@ubuntu-desktop:~# pip --version
pip 22.0.2 from /usr/lib/python3/dist-packages/pip (python 3.10)
```

```
ubuntu_client:~# pip install --upgrade pip
```

```
root@ubuntu-desktop:~# pip install --upgrade pip
Requirement already satisfied: pip in /usr/lib/python3/dist-packages (22.0.2)
Collecting pip
  Downloading pip-23.1.2-py3-none-any.whl (2.1 MB)
     ━━━━━━━━━━━━━━━━━━━━━━━━━━━━ 2.1/2.1 MB 4.2 MB/s eta 0:00:00
Installing collected packages: pip
  Attempting uninstall: pip
    Found existing installation: pip 22.0.2
    Not uninstalling pip at /usr/lib/python3/dist-packages, outside environment /usr
    Can't uninstall 'pip'. No files were found to uninstall.
Successfully uninstalled pip-23.1.2
WARNING: Running pip as the 'root' user can result in broken permissions and conflicting behaviour with the system package manager. It is recommended to use a virtual environment instead: https://pip.pypa.io/warnings/venv
root@ubuntu-desktop:~# pip --version
pip 23.1.2 from /usr/local/lib/python3.10/dist-packages/pip (python 3.10)
root@ubuntu-desktop:~#
```

## 5.2 Install miniconda

```
ubuntu_client:~# wget https://repo.anaconda.com/miniconda/Miniconda3-py310\_23.3.1-0-Linux-x86\_64.sh
```

```
ubuntu_client:~# chmod -R 777 Miniconda3-py310_23.3.1-0-Linux-x86_64.sh
```

```
ubuntu_client:~# ./Miniconda3-py310_23.3.1-0-Linux-x86_64.sh
```

Press ENTER

```
Export: Cryptography Notice  
=====  
  
You must comply with all domestic and international export laws and regulations that apply to the software, which include restrictions on destinations, end users, and end use. Miniconda includes cryptographic software. The country in which you currently reside may have restrictions on the import, possession, use, and/or re-export to another country, of encryption software. BEFORE using any encryption software, please check your country's laws, regulations and policies concerning the import, possession, or use, and re-export of encryption software, to see if this is permitted. See the Wassenaar Arrangement http://www.wassenaar.org/ for more information.  
  
Anaconda has self-classified this software as Export Commodity Control Number (ECCN) EAR99, which includes mass market information security software using or performing cryptographic functions with asymmetric algorithms. No license is required for export of this software to non-embargoed countries.  
  
The Intel Math Kernel Library contained in Miniconda is classified by Intel as ECCN SD992.c with no license required for export to non-embargoed countries.  
  
The following packages listed on https://www.anaconda.com/cryptography are included in the Repository accessible through Miniconda that relate to cryptography.

### 5.3.4 Install python library

#### 5.3.4.1 Pillow

(metadata) ubuntu\_client:~# conda install -c anaconda pillow

```
(metadata) root@ubuntu-desktop:~# conda install -c anaconda pillow
Collecting package metadata (current_repodata.json): done
Solving environment: done

## Package Plan ##

environment location: /root/miniconda3/envs/metadata

added / updated specs:
- pillow

The following packages will be downloaded:

package          |      build
-----|-----
ca-certificates-2023.01.10 | h06a4308_0      127 KB  anaconda
certifi-2020.6.20    | pyhd3eb1b0_3      159 KB  anaconda
lcms2-2.12         | h3be6417_0      396 KB  anaconda
pillow-9.4.0        | py31lh6a678d5_0     815 KB

Total:           1.5 MB

The following NEW packages will be INSTALLED:

lcms2            anaconda/linux-64::lcms2-2.12-h3be6417_0
pillow           pkgs/main/linux-64::pillow-9.4.0-py31lh6a678d5_0

The following packages will be SUPERSEDED by a higher-priority channel:

ca-certificates                  pkgs/main --> anaconda
certifi                         pkgs/main/linux-64::certifi-2023.5.7~- --> anaconda/noarch::certifi-2020.6.20-pyhd3eb1b0_3

Proceed ([y]/n)? y

## 6 Install Running-Script Environment on Client Windows OS

### 6.1 Install Anaconda

<https://docs.anaconda.com/free/anaconda/install/windows/>

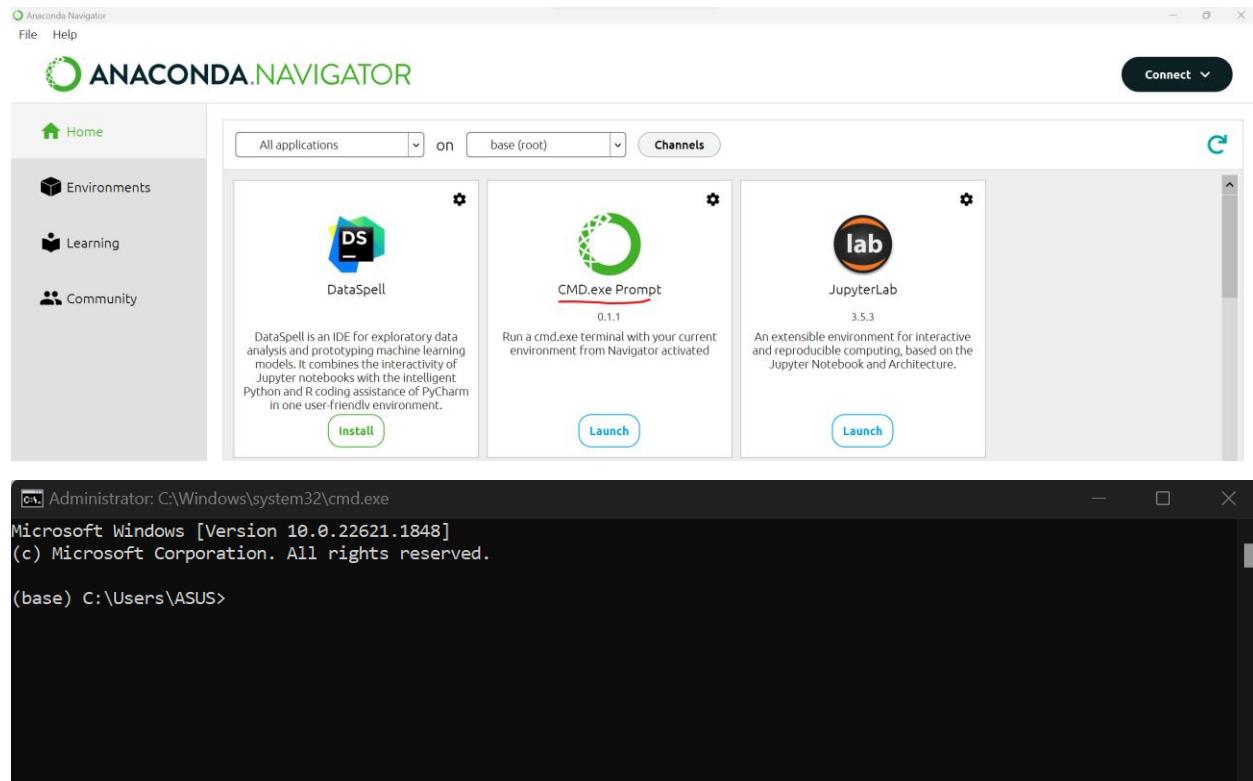

## 6.2 Install Jupyter

Anaconda already has Jupyter, you don't need to install just launch it.

## 6.3 Install the Python library

Using **CMD.exe Prompt** to install the library

Install the same Python library as Client Ubuntu OS
